Query Management Facility (QMF)

QMF - Query Management Facility is an IBM licensed software product designed to work with DB2 databases in both an Online and a Batch execution environment. QMF is a query and report writing program for users who have little or no data processing knowledge, as well as those with much experience in the field.

Functions in QMF include:
- Access DB2 data kept in tables
- Perform calculation on that data
- Insert new data
- Change or delete existing data
- Produce and print reports
- Create and format charts

QMF can be accessed through TSO Logon Procs, options O, D or through batch execution. Both RACF authorization to the logon proc and DB2 Authorization by the owning Database Analyst is required to access DB2 data via QMF. Contact your DB2 DBA for details on access and/or usage. QMF Batch execution can be done using batch proc QMFTBAT.
